All in the family at House of Cupcakes

By Angela Kim

The Princeton Summer Journal

Stoic Kathleen Reilly, a Princetonian, serves as judge and salesperson at the annual Kids at Work Cupcake Wars competition. She listened carefully to each student as they delivered their presentations on their cupcake creations.

"I was impressed by the creativity and skill of the students," said Reilly, who was a judge in the competition.

The competition is organized by the Summer Enrichment Program for rising seventh-graders. It provides an opportunity for students to explore their interests in science, technology, engineering, and math through hands-on projects.

The competition is open to all students in the Princeton area, and it is open to all ages. Students are encouraged to work with their families and teachers to create their projects.

The competition is judged by a panel of experts, who evaluate the projects based on criteria such as creativity, originality, and technical skill.

The winners receive certificates and prizes, and the projects are displayed at the Princeton Public Library.

The competition is a great way for students to explore their interests and learn new skills. It is a great way to learn about the importance of science, technology, engineering, and math in our lives.

Picture this: You are driving down I-95 through the suburbs of Philadelphia. You look out your right window and see smoke and polluting smog from sky-high smoke stacks and cooling towers. You think to yourself that these monstrosities are the reason for climate change.

But while most blame power plants as the cause of the world’s climate problem, Princeton University chemistry professor Andrew Bocarsly visualizes them as a sustainable energy source in the future.

In the coming years, Bocarsly said, industrial carbon dioxide emitters will become the power source of the new, green cars that are forecasted to hit the highway in 2016. He said that industrial carbon dioxide emitters will become a more viable, economical and environmental solution to the problem.

"It is a first step, but I think it may be a long-term solution," Bocarsly said. In 2004, Bocarsly and colleagues published their groundbreaking discovery in the journal of the American Chemical Society. Entitled "Pyridine," the story of the new discovery was realized the next two years. In 2006, Bocarsly and Teamey co-founded a company called Light in Princeton.

At first Bocarsly wanted to use the power cell to make ethanol, but he realized that it lacked a vital ingredient: a market. However, he soon realized that the cell could also produce other carbon compounds, such as bisamides, which are more marketable and economical than methanol.

Now he hopes to sell a working prototype of the cell, which he said could produce other carbon compounds, such as bisamides, which are more marketable and economical than methanol.

As of now, the scientists are working to create a roll that will be able to capture carbon dioxide in large concentrations from power plants, power companies and cement factories. The company may also look to invent a cell that can extract fluid carbon dioxide molecules from the atmosphere, but the science doesn’t seem to be available yet.

Still, Bocarsly believes his new product will help the environment by reducing the amount of carbon dioxide released into the atmosphere.

"It will not decrease it from where it is, but we can slow it down," he said.

CO2 pollution is just one of the challenges. The company also faces other challenges. The catalyst used in the chemical reaction for the CO2 reduction is minimal.

As of now, the scientists are working to create a roll that will be able to capture carbon dioxide in large concentrations from power plants, power companies and cement factories. The company may also look to invent a cell that can extract fluid carbon dioxide molecules from the atmosphere, but the science doesn’t seem to be available yet.

Still, Bocarsly believes his new product will help the environment by reducing the amount of carbon dioxide released into the atmosphere.

"It will not decrease it from where it is, but we can slow it down," he said.

GDP VP pick raises questions

RYAN

Ryan's moves for the future.

He added, "In large part, I agree with my economic policy. You can read the money in there, because it's not just new TARP-type measures. Conservative enthusiasts for Romney have at times called for $50 billion in subsidies, but they're probably at $1.5 trillion, and we'd be better off with $50 billion." Romney's other economic policies included opposition to the Tea Party in 2005 and support for Mitt Romney's tax plan. "I think it may be a long-term solution," Bocarsly said. In 2004, Bocarsly and colleagues published their groundbreaking discovery in the journal of the American Chemical Society. Entitled "Pyridine," the story of the new discovery was realized the next two years. In 2006, Bocarsly and Teamey co-founded a company called Light in Princeton.

At first Bocarsly wanted to use the power cell to make ethanol, but he realized that it lacked a vital ingredient: a market. However, he soon realized that the cell could also produce other carbon compounds, such as bisamides, which are more marketable and economical than methanol.

Now he hopes to sell a working prototype of the cell, which he said could produce other carbon compounds, such as bisamides, which are more marketable and economical than methanol.

As of now, the scientists are working to create a roll that will be able to capture carbon dioxide in large concentrations from power plants, power companies and cement factories. The company may also look to invent a cell that can extract fluid carbon dioxide molecules from the atmosphere, but the science doesn’t seem to be available yet.

Still, Bocarsly believes his new product will help the environment by reducing the amount of carbon dioxide released into the atmosphere.

"It will not decrease it from where it is, but we can slow it down," he said.

It literally takes millions of dollars to do this," said Bocarsly. "It could take several years for their processes to get into the commercial market."

The business also faces other challenges. The rate first used in the chemical reaction, pyridine, is rather minimal. But it is not as potent as methane, or CO2. The company might still consider producing pyridine. "Pyridine will be less of an issue than the methanol will," according to Bocarsly, because in the amount of pyridine used in the chemical reaction is minimal.

As of now, the scientists are working to create a roll that will be able to capture carbon dioxide in large concentrations from power plants, power companies and cement factories. The company may also look to invent a cell that can extract fluid carbon dioxide molecules from the atmosphere, but the science doesn’t seem to be available yet.

2,100,000,000 years before the Eastern Hemisphere's first Homo sapiens had even evolved, a six-year-old girl named Hushpuppy, while wading around in the river, encountered a herd of aurochs—prehistoric cousins of the modern-day bull. Hushpuppy, with her eye of the elephant, the world of a bright and conscious folk music plays during a communal celebration.

The rising of the surrounding waters threatens life at the “Bathtub,” a desperately needed but nearly impossible to find glory in despair, is both vulnerable and...
The continuing relevance of Lauryn Hill

Shereese Morgan

The arts are often seen as an escape to reality, a way to express oneself and a means of revolution. Yet, the work of Lauryn Hill, the iconic singer, has transcended all of these definitions and has become a symbol of the struggle against racism, sexism, and materialism. Hill’s music has inspired generations of artists and activists, and her influence continues to be felt today.

As a leader in the hip-hop community, Hill’s music has played a crucial role in shaping the genre. Her debut album, “The Miseducation of Lauryn Hill,” was released in 1998 and quickly became a cultural phenomenon. The album was praised for its emotional depth and its raw, honest lyrics, which explored themes of love, loss, and social injustice.

Hill’s music was not just a product of her personal experience; it was also a reflection of the experiences of others. In an interview with The Princeton Summer Journal, Hill explained that her music was a way to connect with others and to provide a voice for those who felt unheard. She said, “I feel like music is a medium that can reach people and bring them together.”

Over the years, Hill’s music has continued to inspire and empower. Her songs have become anthems for social justice movements, and her message of love and positivity has resonated with audiences around the world. Hill’s influence is still felt today, as younger artists continue to draw inspiration from her music.

Despite her success, Hill’s personal journey has been marked by challenges and struggles. In 2009, she was arrested for not paying taxes, and it took her several years to clear her name. However, Hill’s resilience and determination have made her a role model for many.

In conclusion, Lauryn Hill’s music has had a profound impact on the world. Her songs have provided a voice for those who feel unheard, and her message of love and positivity continues to inspire and empower. As we look to the future, it is clear that Hill’s influence will continue to be felt for generations to come.

The more than skin deep

MARYLAH AMIRI

As long as I can remember, my skin has been a source of tension. Born in the United States, I grew up in a household where skin color is an integral part of our daily conversations. My family, like many others, was concerned about the impact of skin color on our lives and the world around us. We were always told that we needed to be mindful of our skin tone, as it could affect how others perceived us. As a result, I often felt insecure and struggled with the idea of being perfect. It wasn't until I found the courage to embrace my skin color that I was able to fully understand its impact on my life.

The pressure to conform and fit in is intense, especially for people like me who are confronted with the idea of being different. I remember being in elementary school and being told that I was different. As a result, I often felt isolated and struggled with the idea of being accepted for who I am.

As I grew up, I began to understand the power of my skin color and how it could impact my life. I started to embrace my unique features and realized that they were a part of who I am. I learned to appreciate my skin color and found that it was a source of strength and empowerment.

I also discovered that my skin color was a source of inspiration and motivation. I started to see it as a way to celebrate my heritage and culture. I began to appreciate the beauty of my skin color and realized that it was something to be cherished.

As I continue to grow and evolve, I have come to understand that my skin color is a part of who I am. It is a source of strength and inspiration, and I am grateful for it. I have learned to embrace my skin color and appreciate the unique features that it brings. As a result, I feel more confident and empowered, and I am a better person because of it.
Mariachi: The music of my soul

Karen Oropeza

Northern, Tex.

I've been drawn to mariachi since I was a young girl. I think this might have to do with the way mariachi has always welcomed and embraced me. My love for mariachi is unbreakable. This love is the driving force behind my commitment to sharing the music of my soul.

Mariani wasn't just my father's expectation. Mariani was a lifelong mission for my father. He instilled in me his passion for mariachi, a traditional Mexican music form, and he taught me the history of the music. He made me feel proud to be Mexican American, and he instilled in me that I had the duty to be a mariachi musician. I knew that I had to work hard to make mariachi music.

When I was a little girl, I sang with my heart and soul. I sang for my father and for the people who were listening. I sang for the future of mariachi music. I sang for my family. I sang for the world.

I'm grateful to have had the opportunity to share my love for mariachi with others. I'm grateful to have had the opportunity to make music with others. I'm grateful to have had the opportunity to share my story.

My father was a traditional mariachi musician, and he was proud of his heritage. He was proud of his music. He was proud of me.

I'm proud of my father. I'm proud of my heritage. I'm proud of my music. I'm proud of my story.

I'm grateful to have had the opportunity to share my love for mariachi with others. I'm grateful to have had the opportunity to make music with others. I'm grateful to have had the opportunity to share my story.

I'm grateful to have had the opportunity to share my love for mariachi with others. I'm grateful to have had the opportunity to make music with others. I'm grateful to have had the opportunity to share my story.

I'm grateful to have had the opportunity to share my love for mariachi with others. I'm grateful to have had the opportunity to make music with others. I'm grateful to have had the opportunity to share my story.

I'm grateful to have had the opportunity to share my love for mariachi with others. I'm grateful to have had the opportunity to make music with others. I'm grateful to have had the opportunity to share my story.

I'm grateful to have had the opportunity to share my love for mariachi with others. I'm grateful to have had the opportunity to make music with others. I'm grateful to have had the opportunity to share my story.

I'm grateful to have had the opportunity to share my love for mariachi with others. I'm grateful to have had the opportunity to make music with others. I'm grateful to have had the opportunity to share my story.
Altmann researches baboons’ behavior

BABOON

• “We take any and all allegations seriously and are committed to the care and welfare of all animals.”

Baboon behavior会导致injury to one another at times. Both displays and nonphysical forms of aggression are common, and the activity is intended to establish dominance, either among unrelated individuals or within groups. Baboons are highly social creatures, living in large troops that are divided into functional subgroups. Each group has a dominant male, or alpha male, who is responsible for maintaining group cohesion and deter­mining the group’s direction. Baboons are also highly cooperative, working together on tasks such as foraging for food and defending the group against threats.

In Kenya, the lack of resources and the limited access to medical care and veterinary services can lead to poor health outcomes for baboons. For example, a recent study found that baboons in the Maasai Mara National Reserve were suffering from high rates of predation, disease, and habitat loss. The study also highlighted the need for conservation efforts to protect baboons and their habitats.

In conclusion, baboons are complex and fascinating animals that have many behaviors that are important for their survival. Further research is needed to fully understand the factors that influence baboon behavior and to develop effective conservation strategies to protect these animals.

Mascot

Wayne B. Green, Jr.

“Henderson returns home” is a piece that discusses the return of a coach to his alma mater, Princeton. The coach, named Henderson, has a background of playing and coaching basketball. He had a successful high school coaching career before moving on to coaching at a higher level. The article highlights Henderson's career and his return to Princeton, where he played basketball. The piece also touches on his coaching philosophy and how he views his role as a coach.

The piece mentions Henderson's return to Princeton, highlighting his career and how it played out. Henderson, a former Princeton basketball player, returned to his alma mater to coach. The article discusses his coaching philosophy and how he sees his role as a coach. The piece also includes quotes from Henderson about his experiences as a player and coach.

The article concludes with a reflection on the influence a coach has on players. It speaks to the importance of a coach's presence and the impact they can have on their players. The piece ends with a quote from Henderson, “I believe the coach is the heart and soul of the team, and it's my job to ensure that every player feels valued and appreciated.”

This piece is a thoughtful exploration of what it means to return home as a coach and the lasting influence a coach can have on players. It provides insight into the world of college basketball coaching and the personal journey that Henderson has taken in his career. The piece is well-written and provides a clear and engaging narrative that keeps the reader engaged from start to finish.
The Trenton Thunder edged the Reading Phils 4-3 in Tuesday night at home, bringing their record for the season to 70-45.

By Lorena Arviles and Ashley Patterson
PHILADELPHIA, Pa.

TRENTON—While most of the crowd at Waterfront Park was absorbed with the late-season matchup between Trenton and Reading, a different, more frenetic type of athletic activity was brewing behind the home team’s dugout.

An 11-year-old boy felt the blood rush to his head, he said. He was punched in the head by a set of monkey bars. "I fell off a set of monkey bars. Some woman who was playingaggerated over and pushed me to the ground," the boy said.

Kevin Anderson, another parent, had a similar reaction: “I didn’t feel anything, but I heard him cry."

Arviles said the team is professional, “It’s a good place for parents to drop off their kids when they want to watch the game in peace. It appears parents weren’t going anywhere, however.

Trenton phase edges Phillies

3:05 a.m.

TRENTON—Fans nearly filled the stands on Aug. 7 as the Trenton Thunder took on the Reading Phillies at home. The game was 4-3, down, in the last inning, with total count 10 of their last 11 wins.

The Thunder allowed two runs.

Kevin Anderson, another parent, had a similar reaction: “I didn’t feel anything, but I heard him cry." The answer to that question is yes.

“This team has exceeded all expectations," said Bill Cook, director of public relations for the Thunder. "We gained the upper hand in the top of the fifth inning after scoring a run in the eighth inning.”

The game was 4-3, down, in the last inning, with total count 10 of their last 11 wins.

Kevin Anderson, another parent, had a similar reaction: “I didn’t feel anything, but I heard him cry.”

Arviles said the team is professional, “It’s a good place for parents to drop off their kids when they want to watch the game in peace. It appears parents weren’t going anywhere, however.
