Contents—Continued

5. Wear Rate Versus Temperature-Humidity Index (THI) ........................................ 15
6. Wear Rate Versus Month ..................................................................................... 15
7. Wear Rate Versus Areal Density of Armor .......................................................... 16
8. “Reenactment” of a Ballistic Test That Armor Shot in an Assault Could Have
   Been Subjected To ................................................................................................. 22
9. Discrimination of the NIJ Test for Protection From the Impact of Stopped Bullets . .. 23
10. Shots Per Panel in Actual Assaults ...................................................................... 24
11. Effect of Wetness on Ballistic Resistance of Kevlar® Armor ................................. 29
12. Estimates of V_{50} and V_{10} Obtained by Logistic Regression ............................. 35

Tables

Table Page
1. *Types* of Ballistic Resistance Defined by NIJ Standard 0101.03 in Terms of
   Bullets and Velocities Specified for Testing ....................................................... 11
2. Tyes of Ballistic Resistance Defined by NIJ Standard 0101.03 in Terms of
   Guns and Ammunition Against Which Protection is Expected ........................... 12
3. Choices for Safety Goals ....................................................................................... 32
