

# Orbitofrontal cortex as a cognitive map of task space: implications for reversal learning and extinction

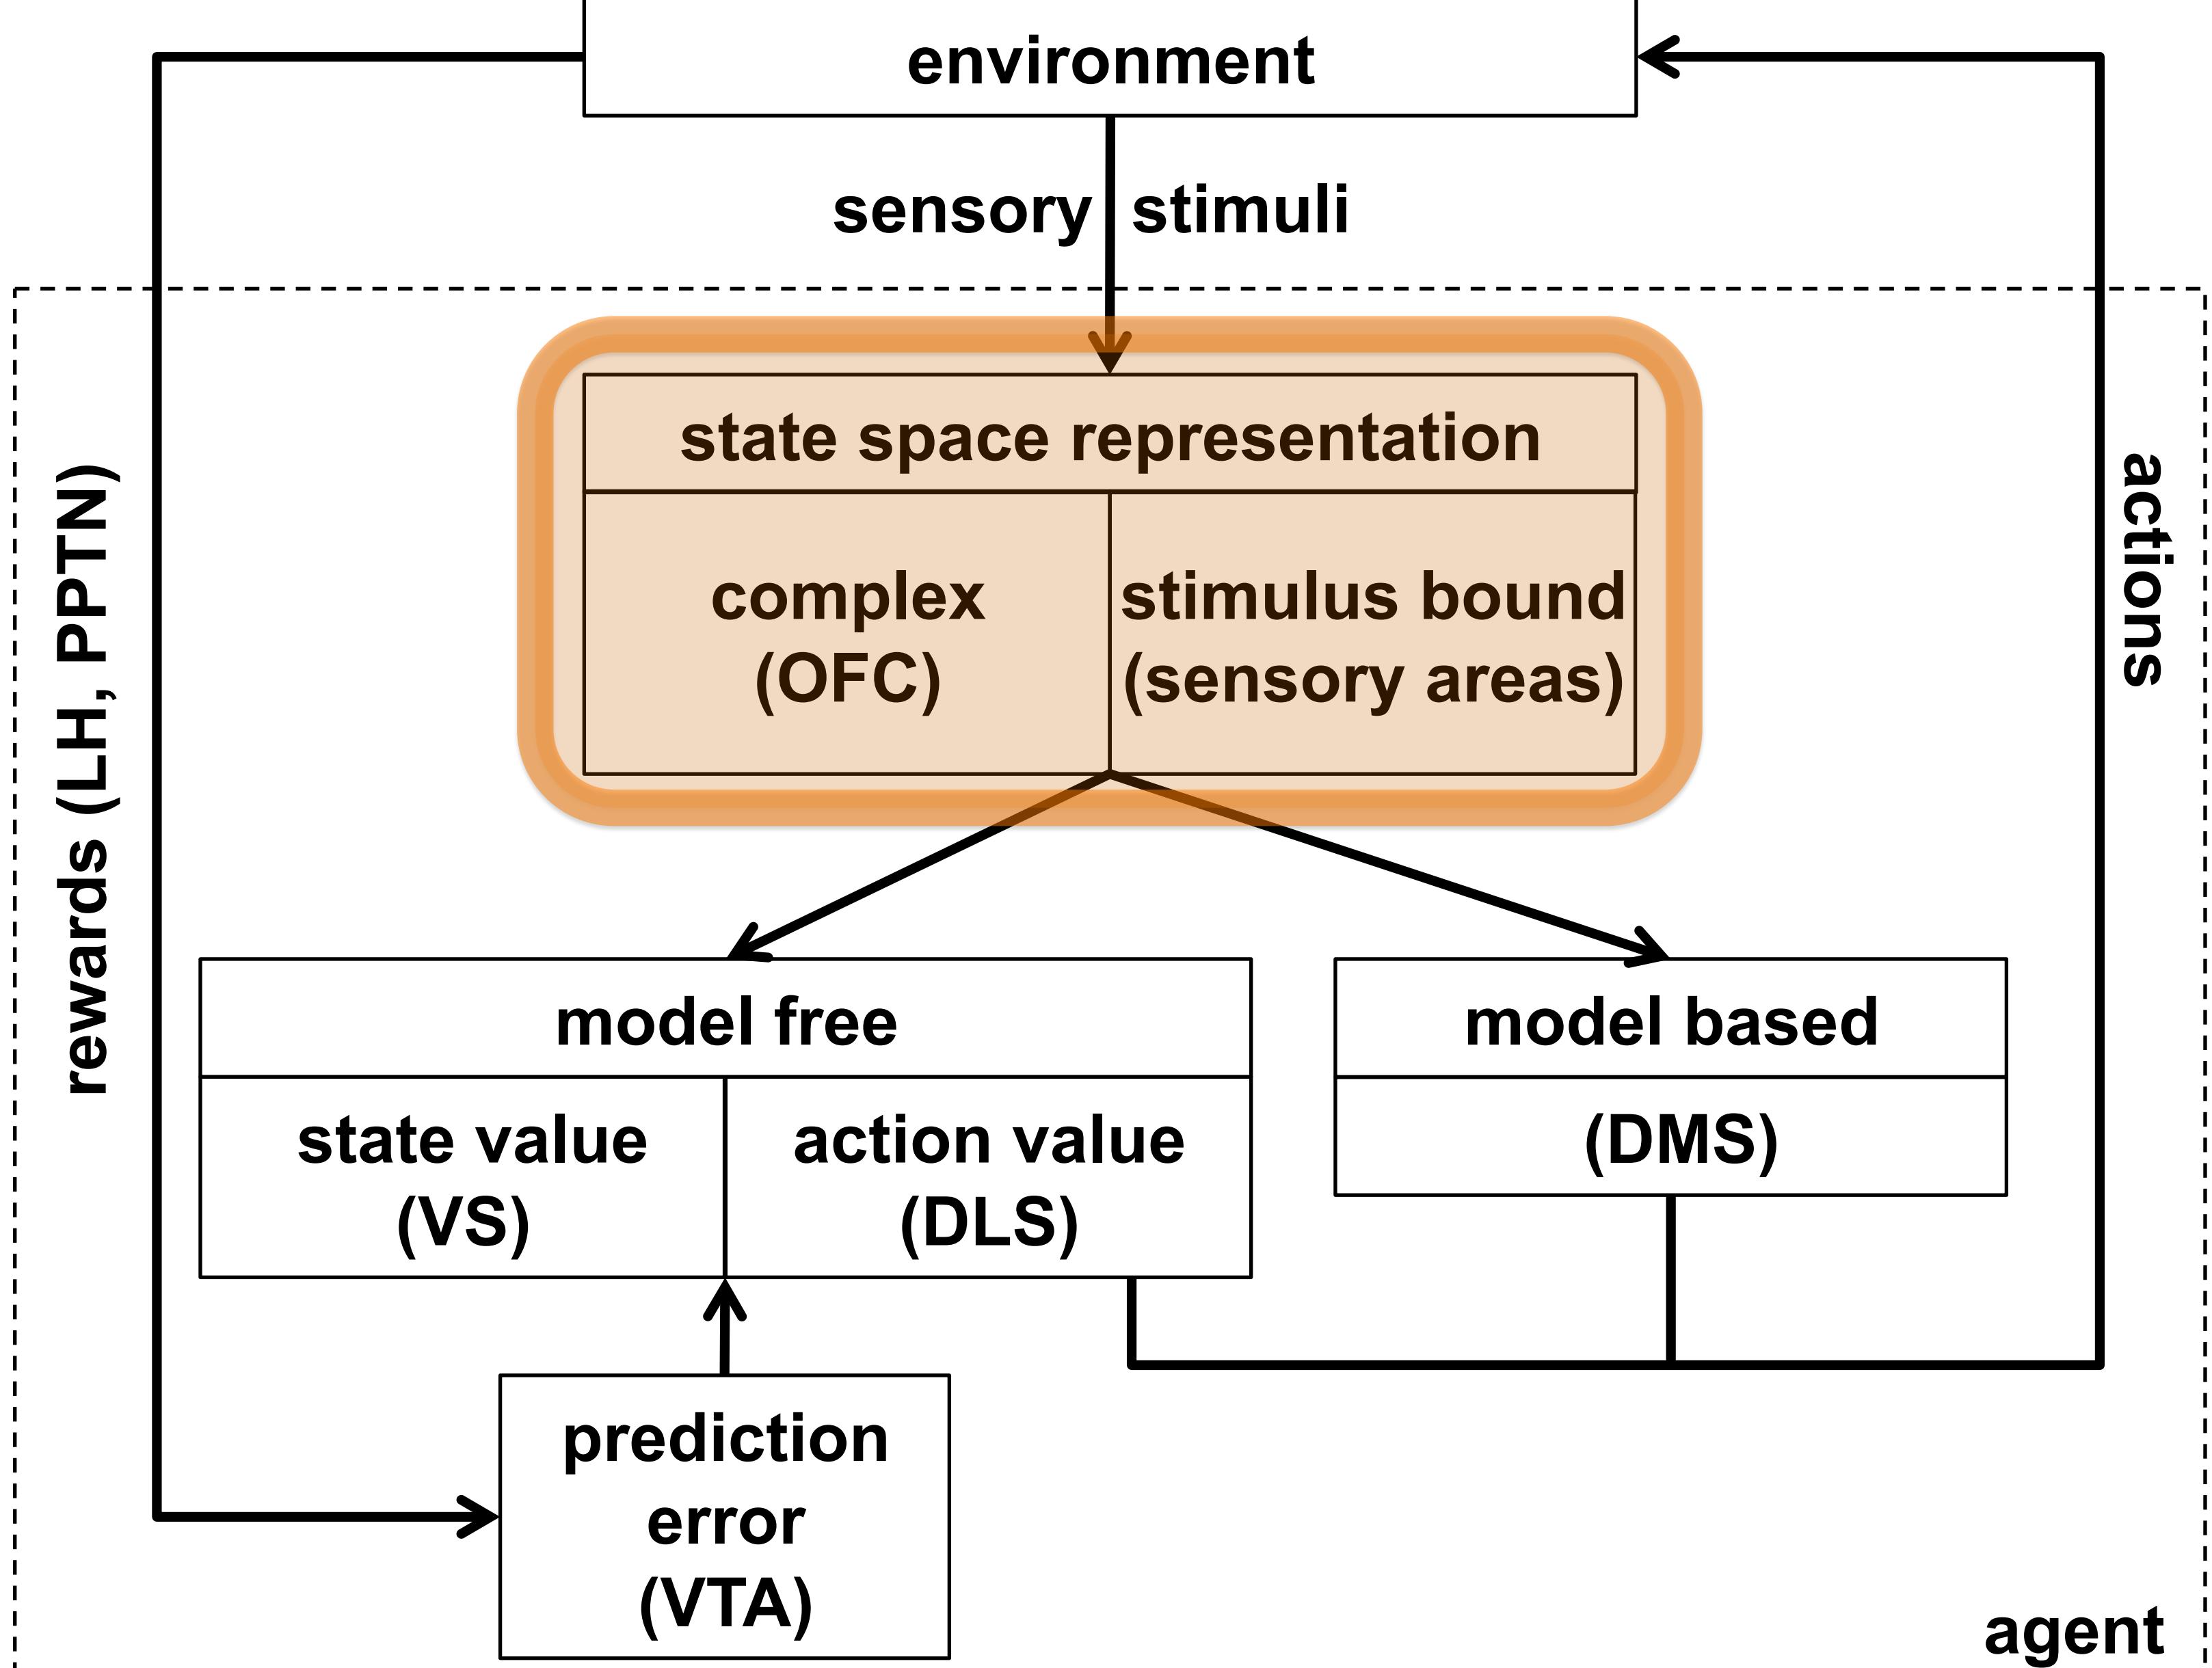

Robert C. Wilson, Yuji K. Takahashi, Geoffrey Schoenbaum and Yael Niv

## Summary

- We have previously proposed [1] that OFC encodes a map of task space in much the same way as hippocampus encodes a map of physical space.
- Here we show how this theory can account for classic effects of OFC lesions on reversal learning and extinction.
- We also make testable predictions about the effects of OFC lesions on spontaneous recovery, renewal, rapid reacquisition and reinstatement

## The Model

- OFC codes complex states, states that rely on abstract information (such as past actions or rewards)
- Without OFC the state-space is stimulus bound

## SARSA learning rule

$$\text{Prediction error : } \delta_t = r_t + \gamma Q(s', a') - Q(s, a)$$

$$\text{Action value update : } Q(s, a) \rightarrow Q(s, a) + \alpha \delta_t$$

$$\text{Action selection : } \pi(a|s) = \frac{\exp(\beta Q(s, a))}{\sum_{a'} \exp(\beta Q(s, a'))}$$

## Reversal learning

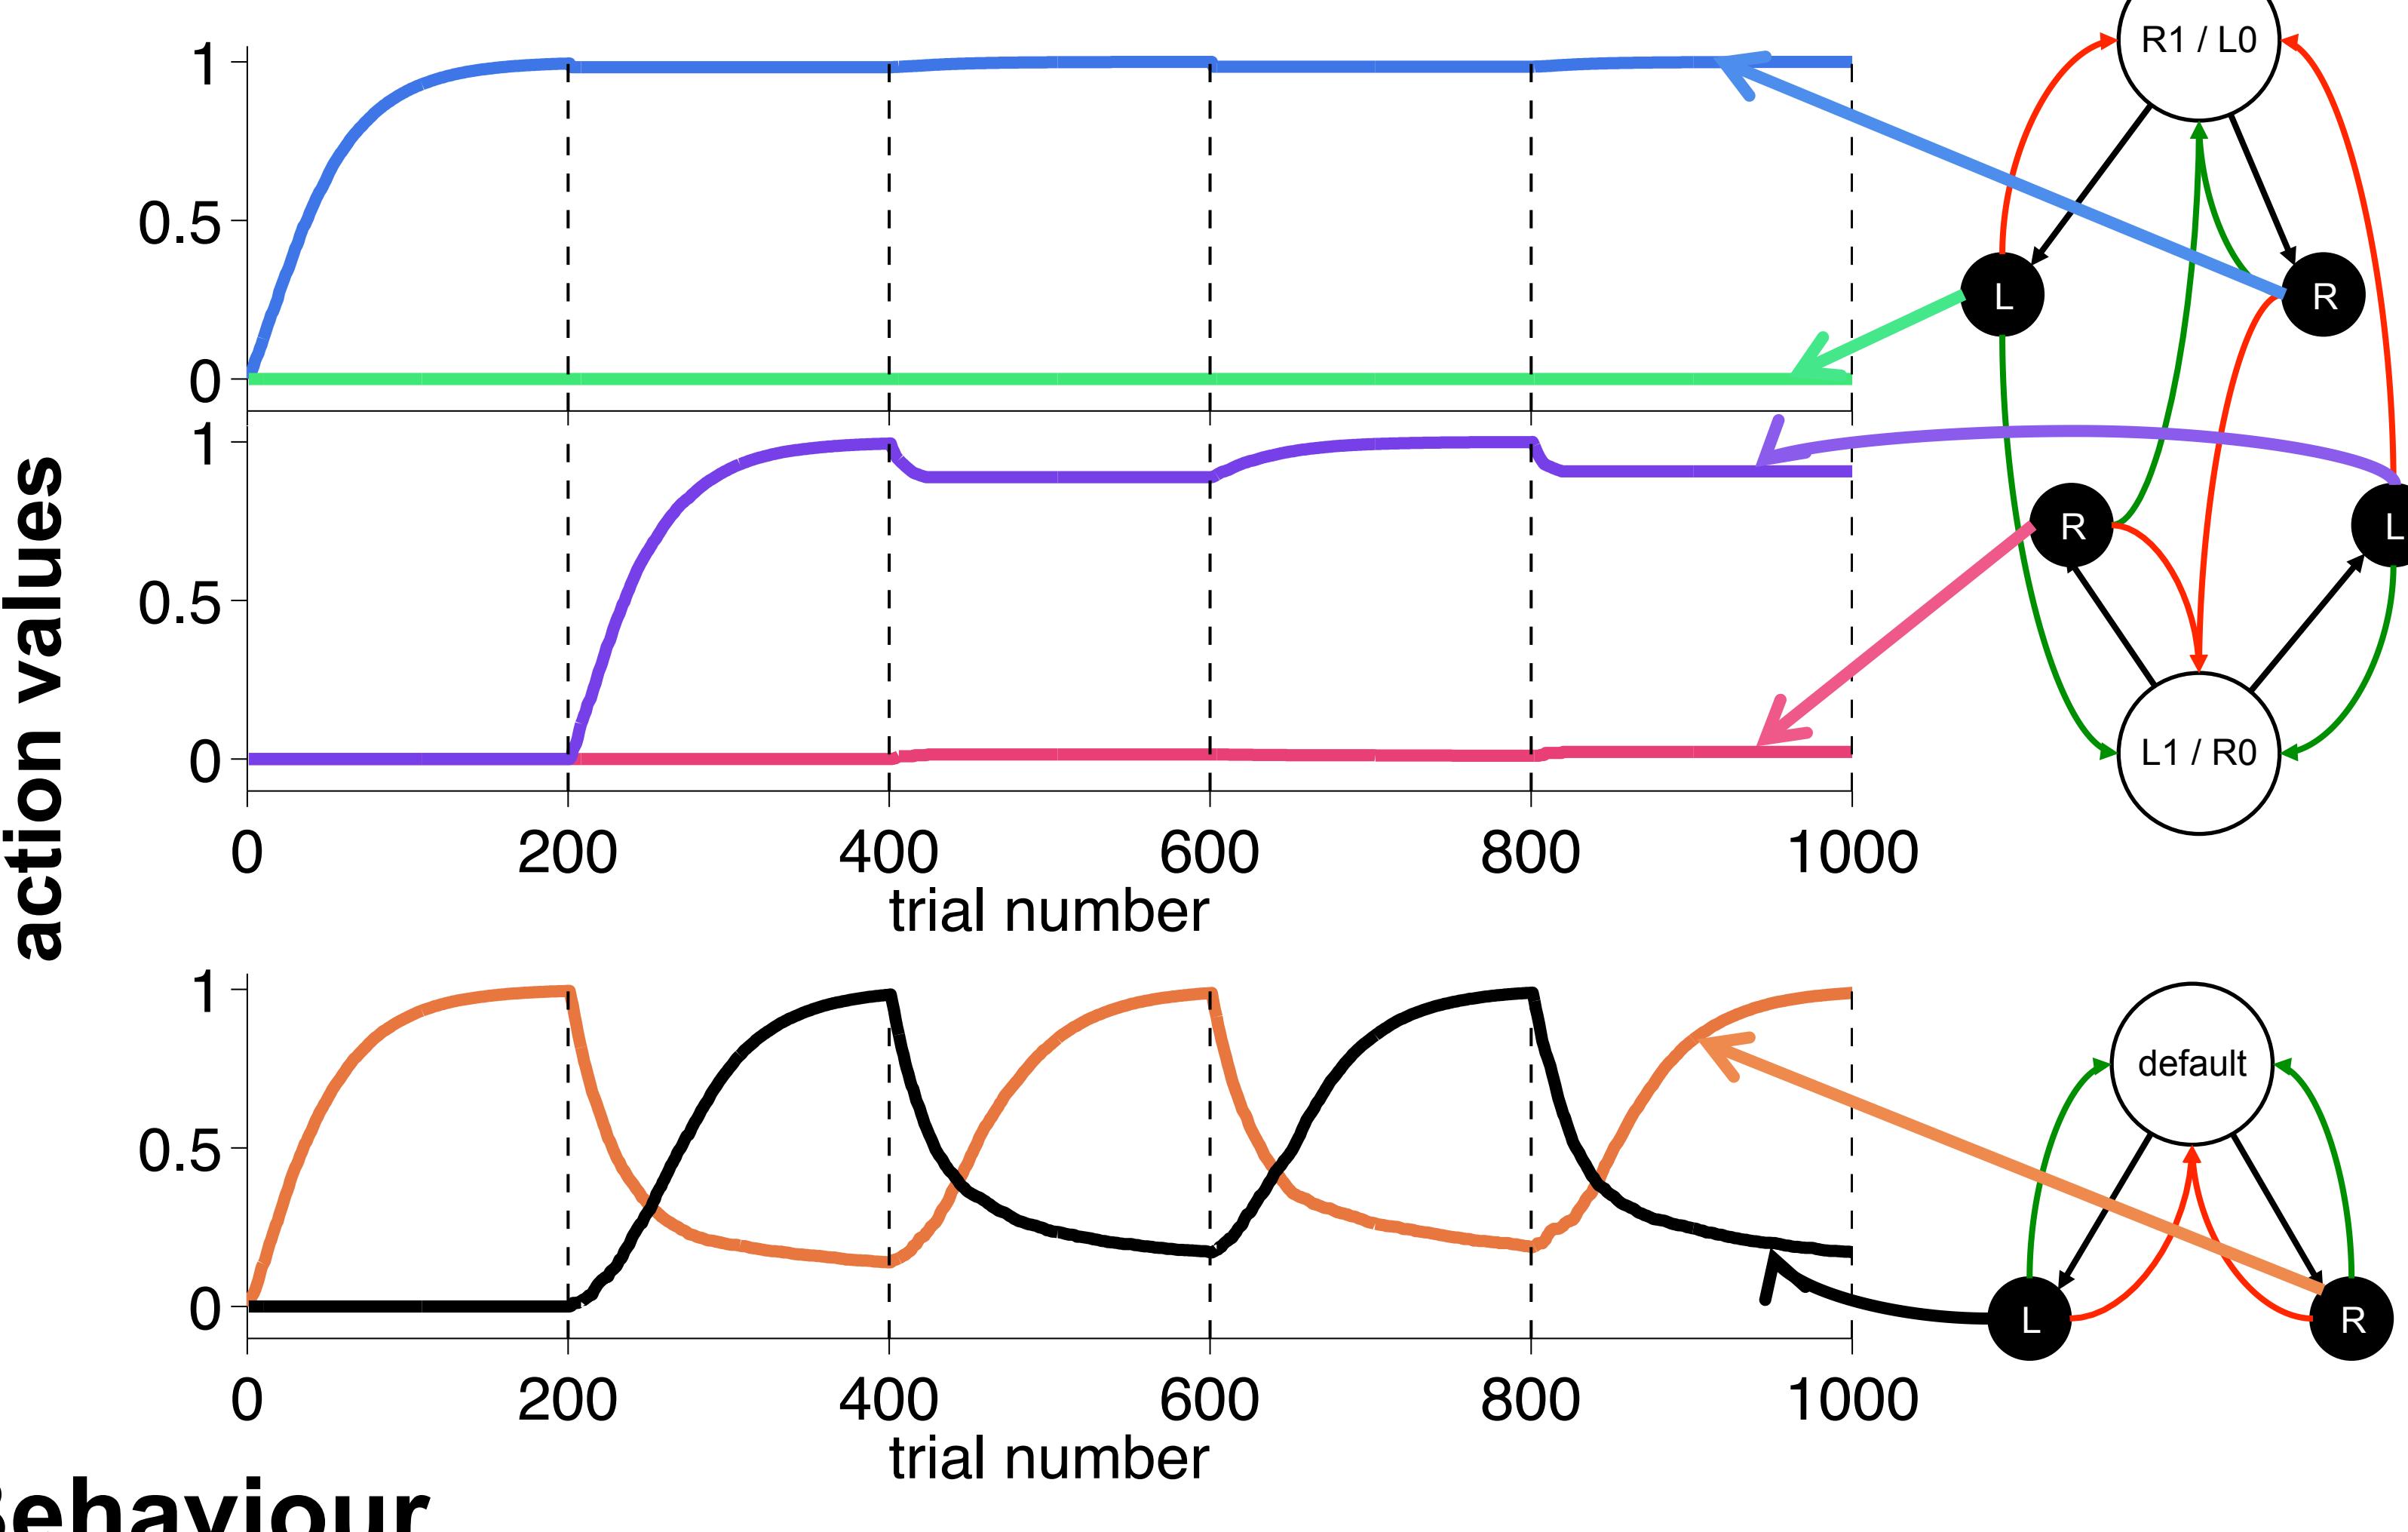

### Task

Discrimination	Reversal 1	Reversal 2
L → 0	R → 1	L → 1
R → 0	L → 0	R → 1

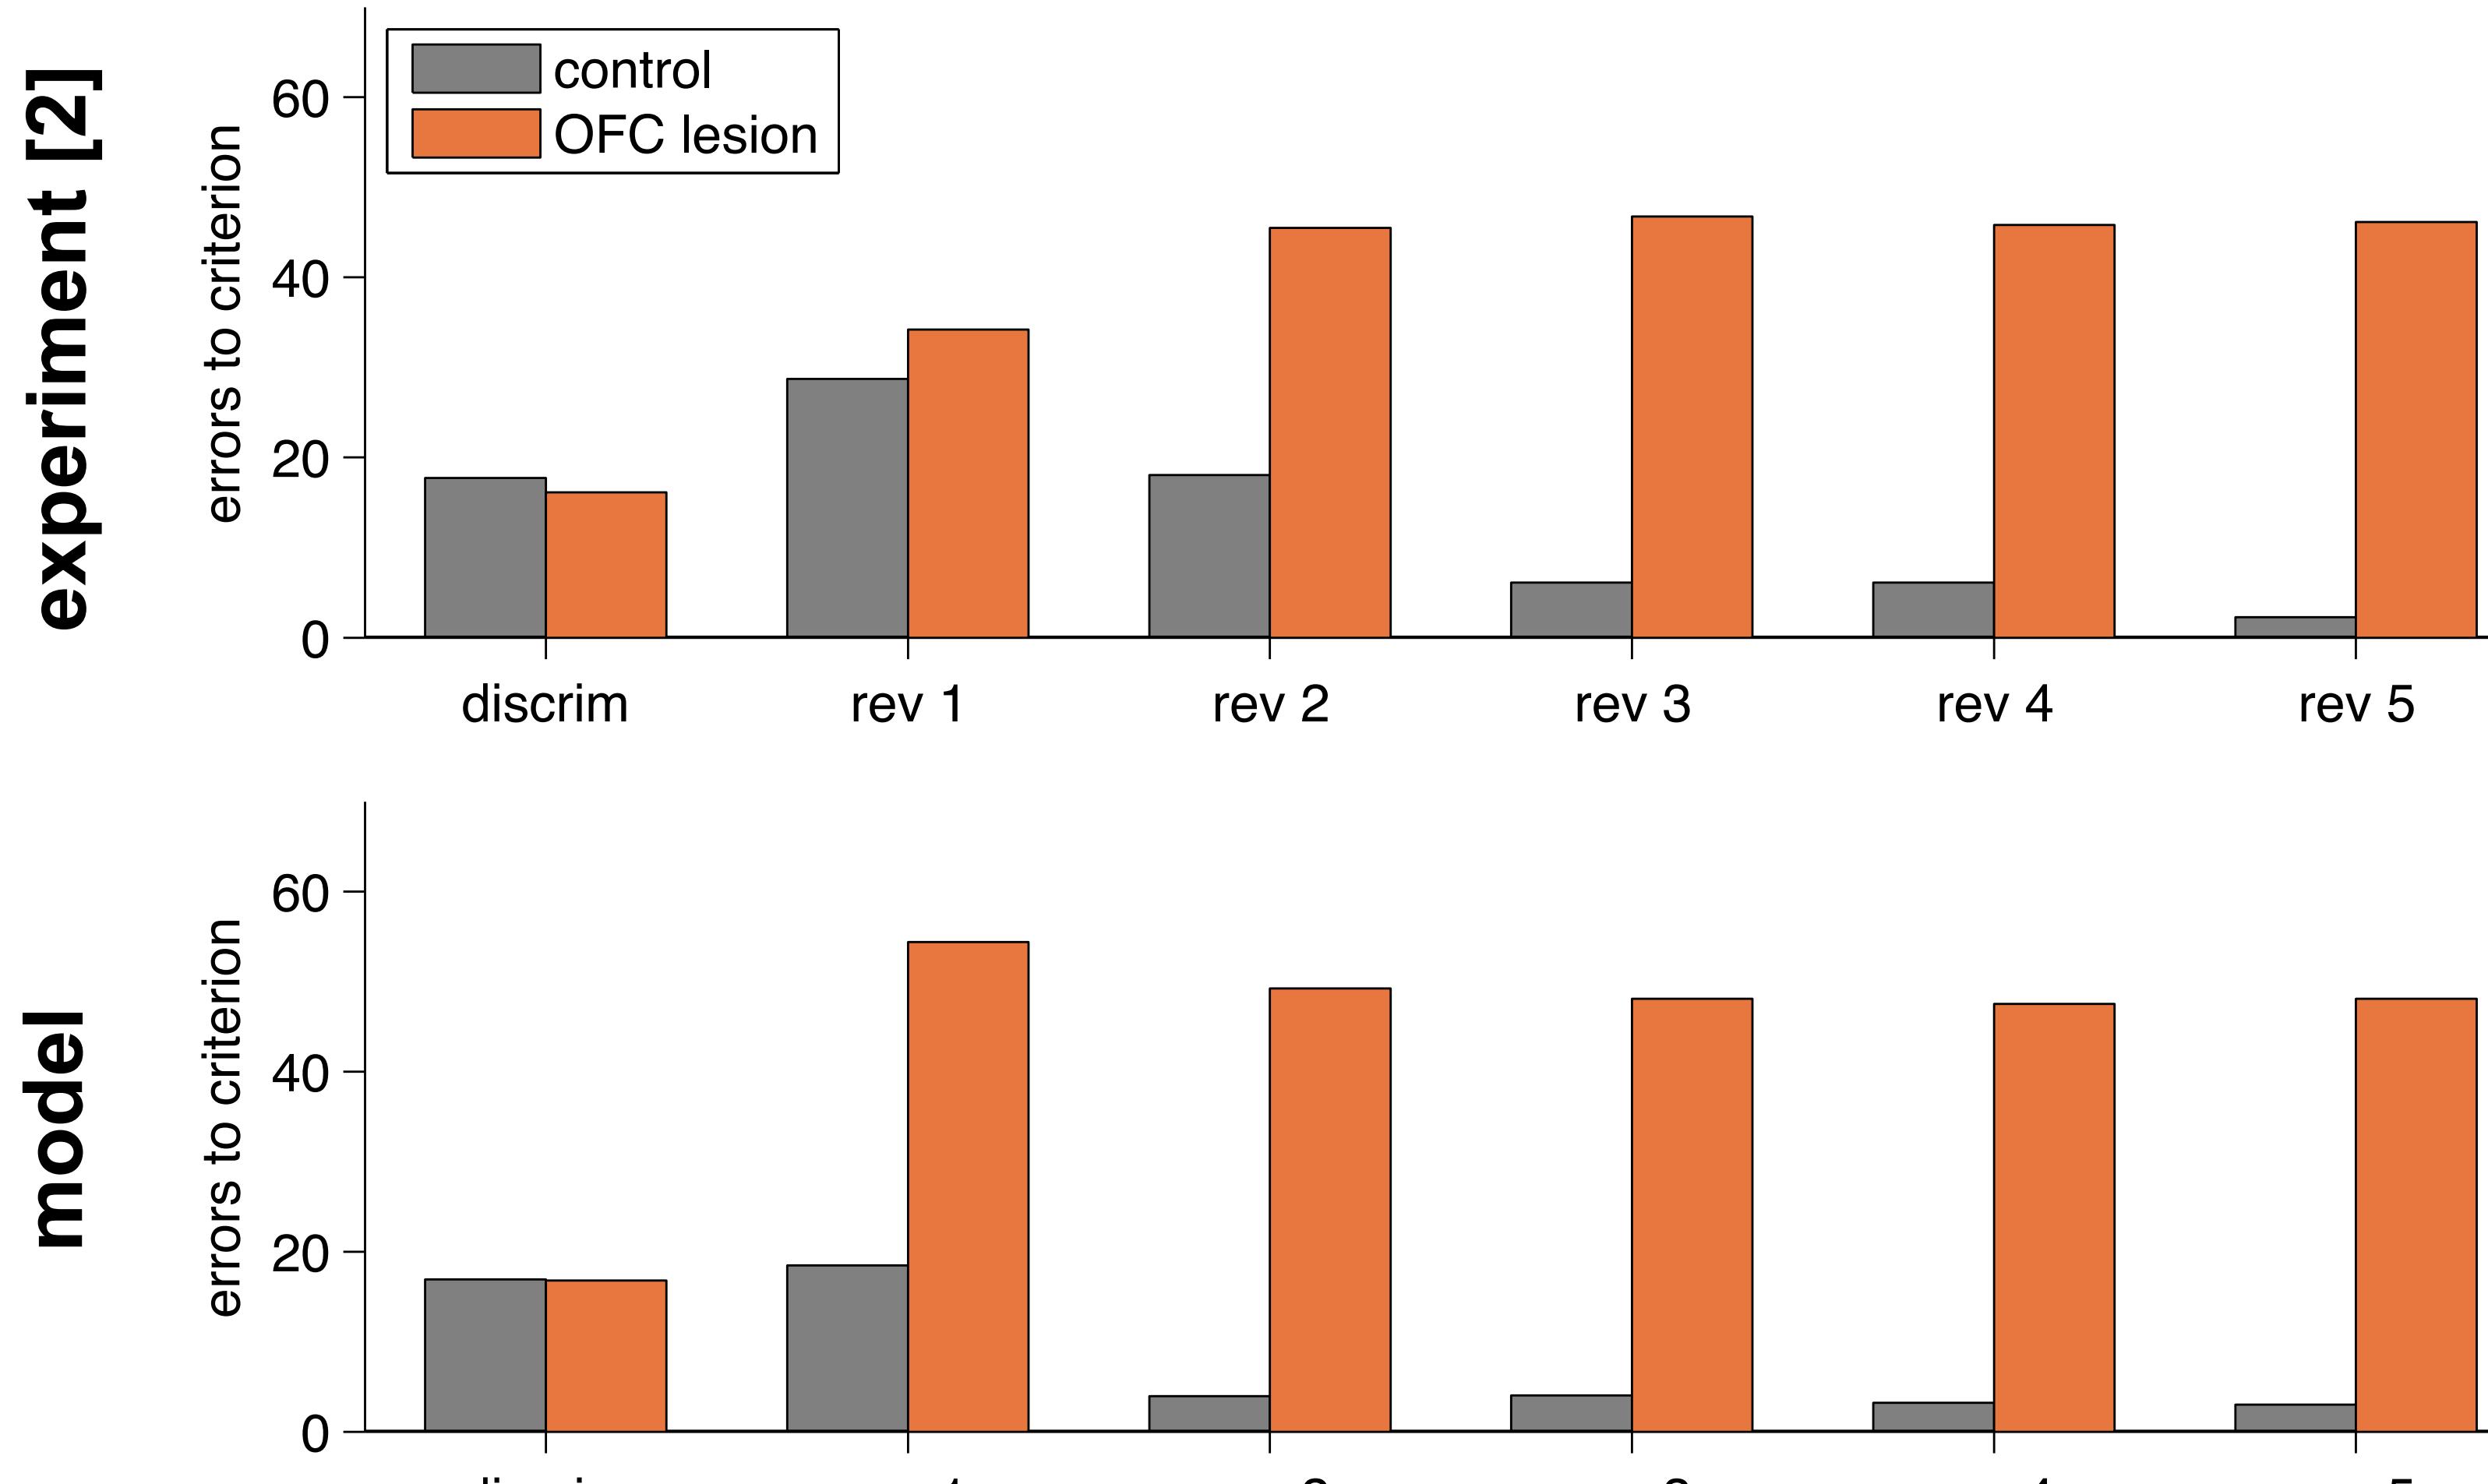

### State-space representation

### Action values

### Behaviour

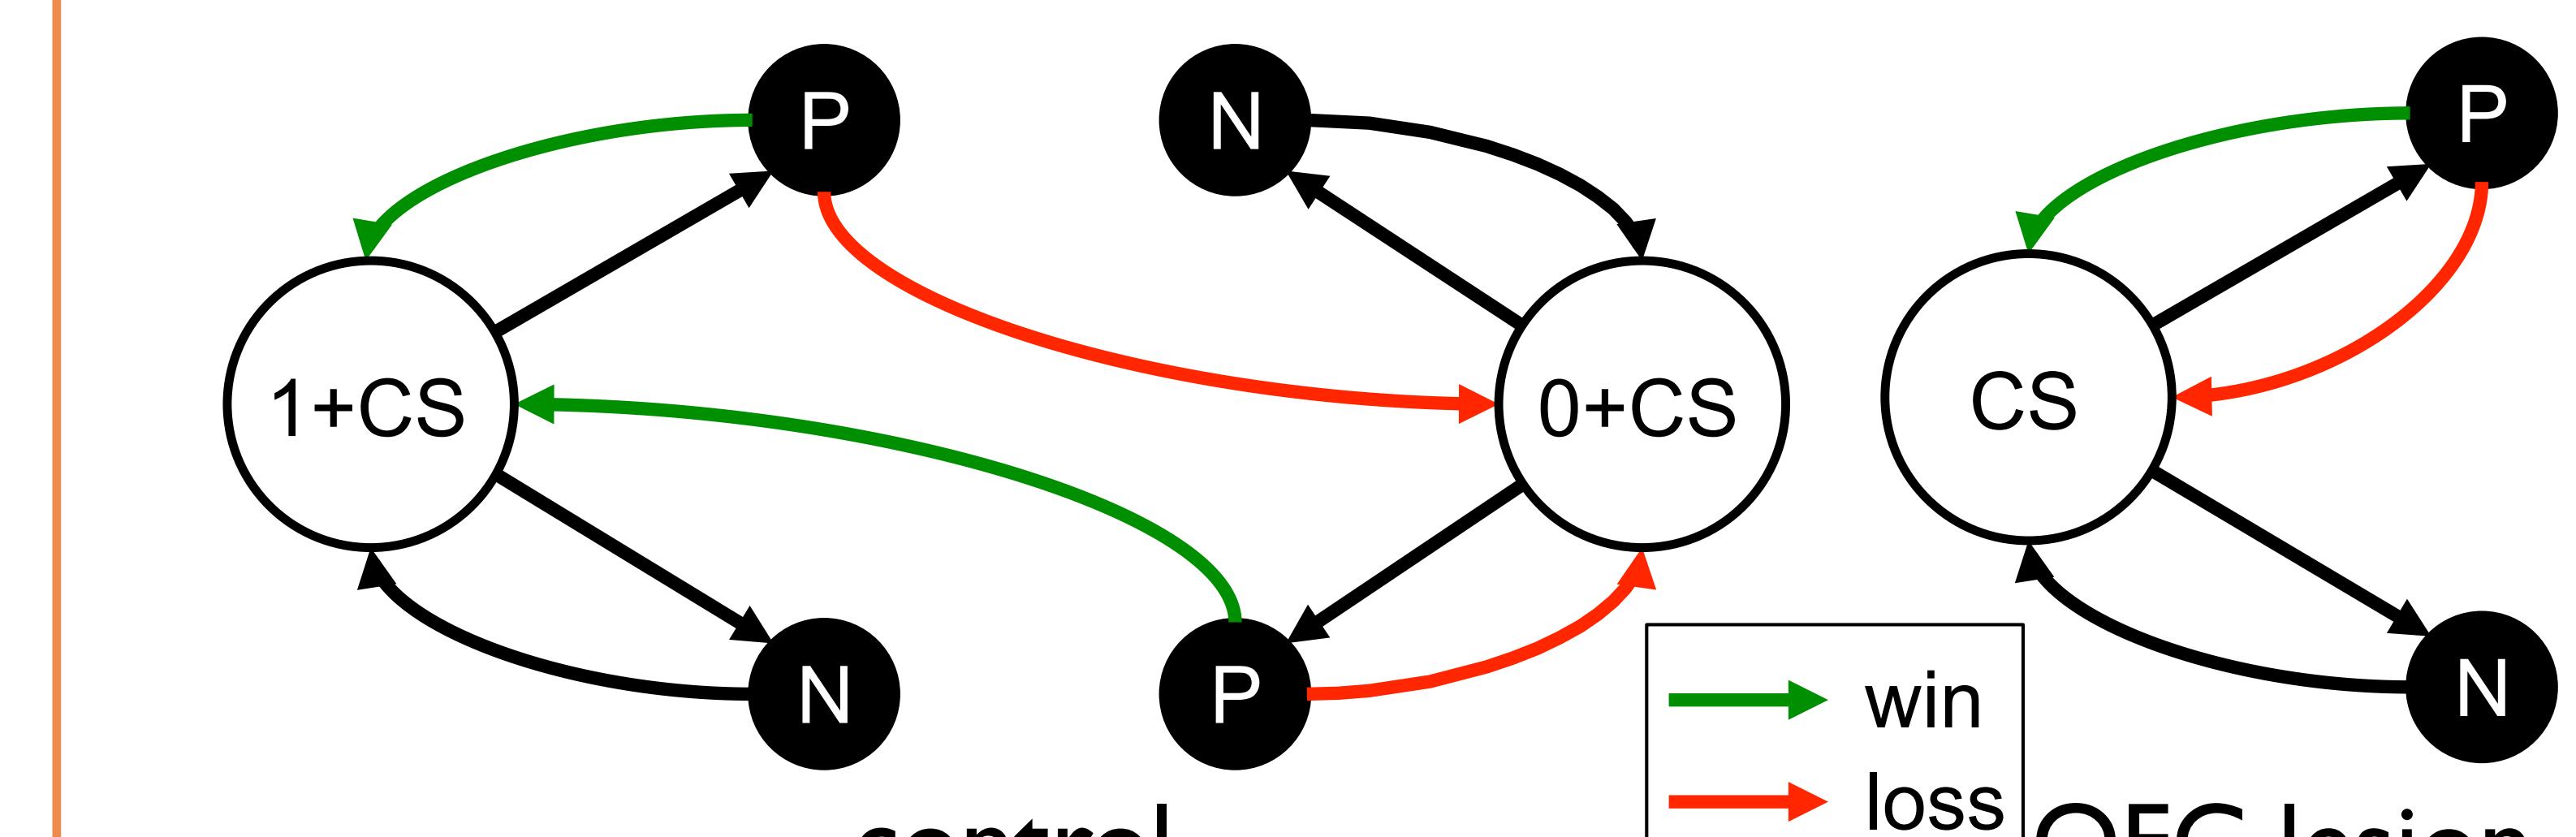

## Extinction

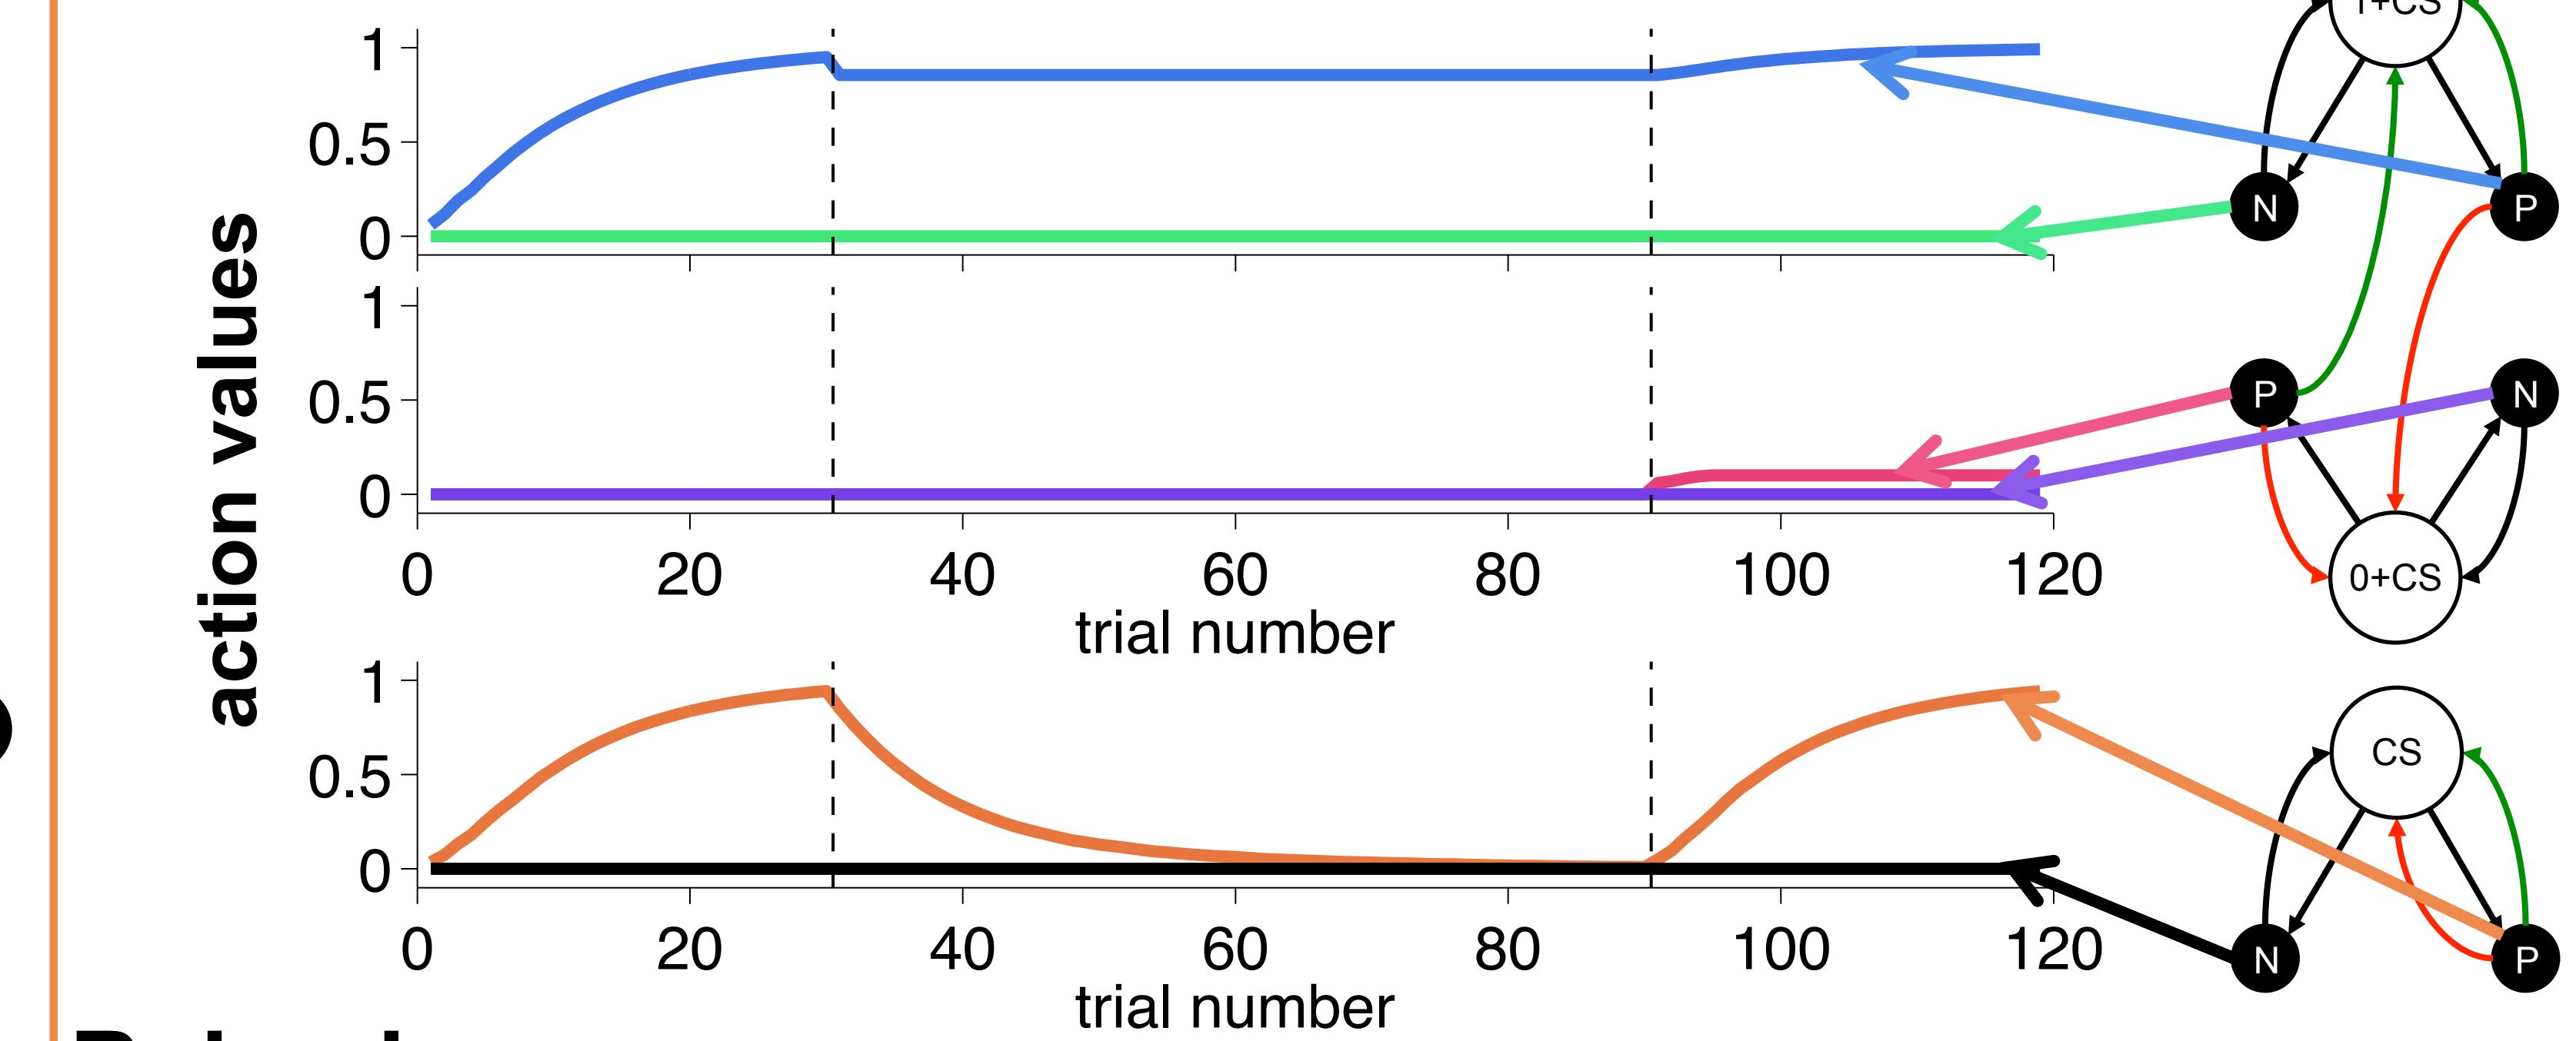

### Task

Conditioning	Extinction	Reacquisition
CS N → 0	CS P → 1	CS N → 0
	CS P → 0	CS P → 1

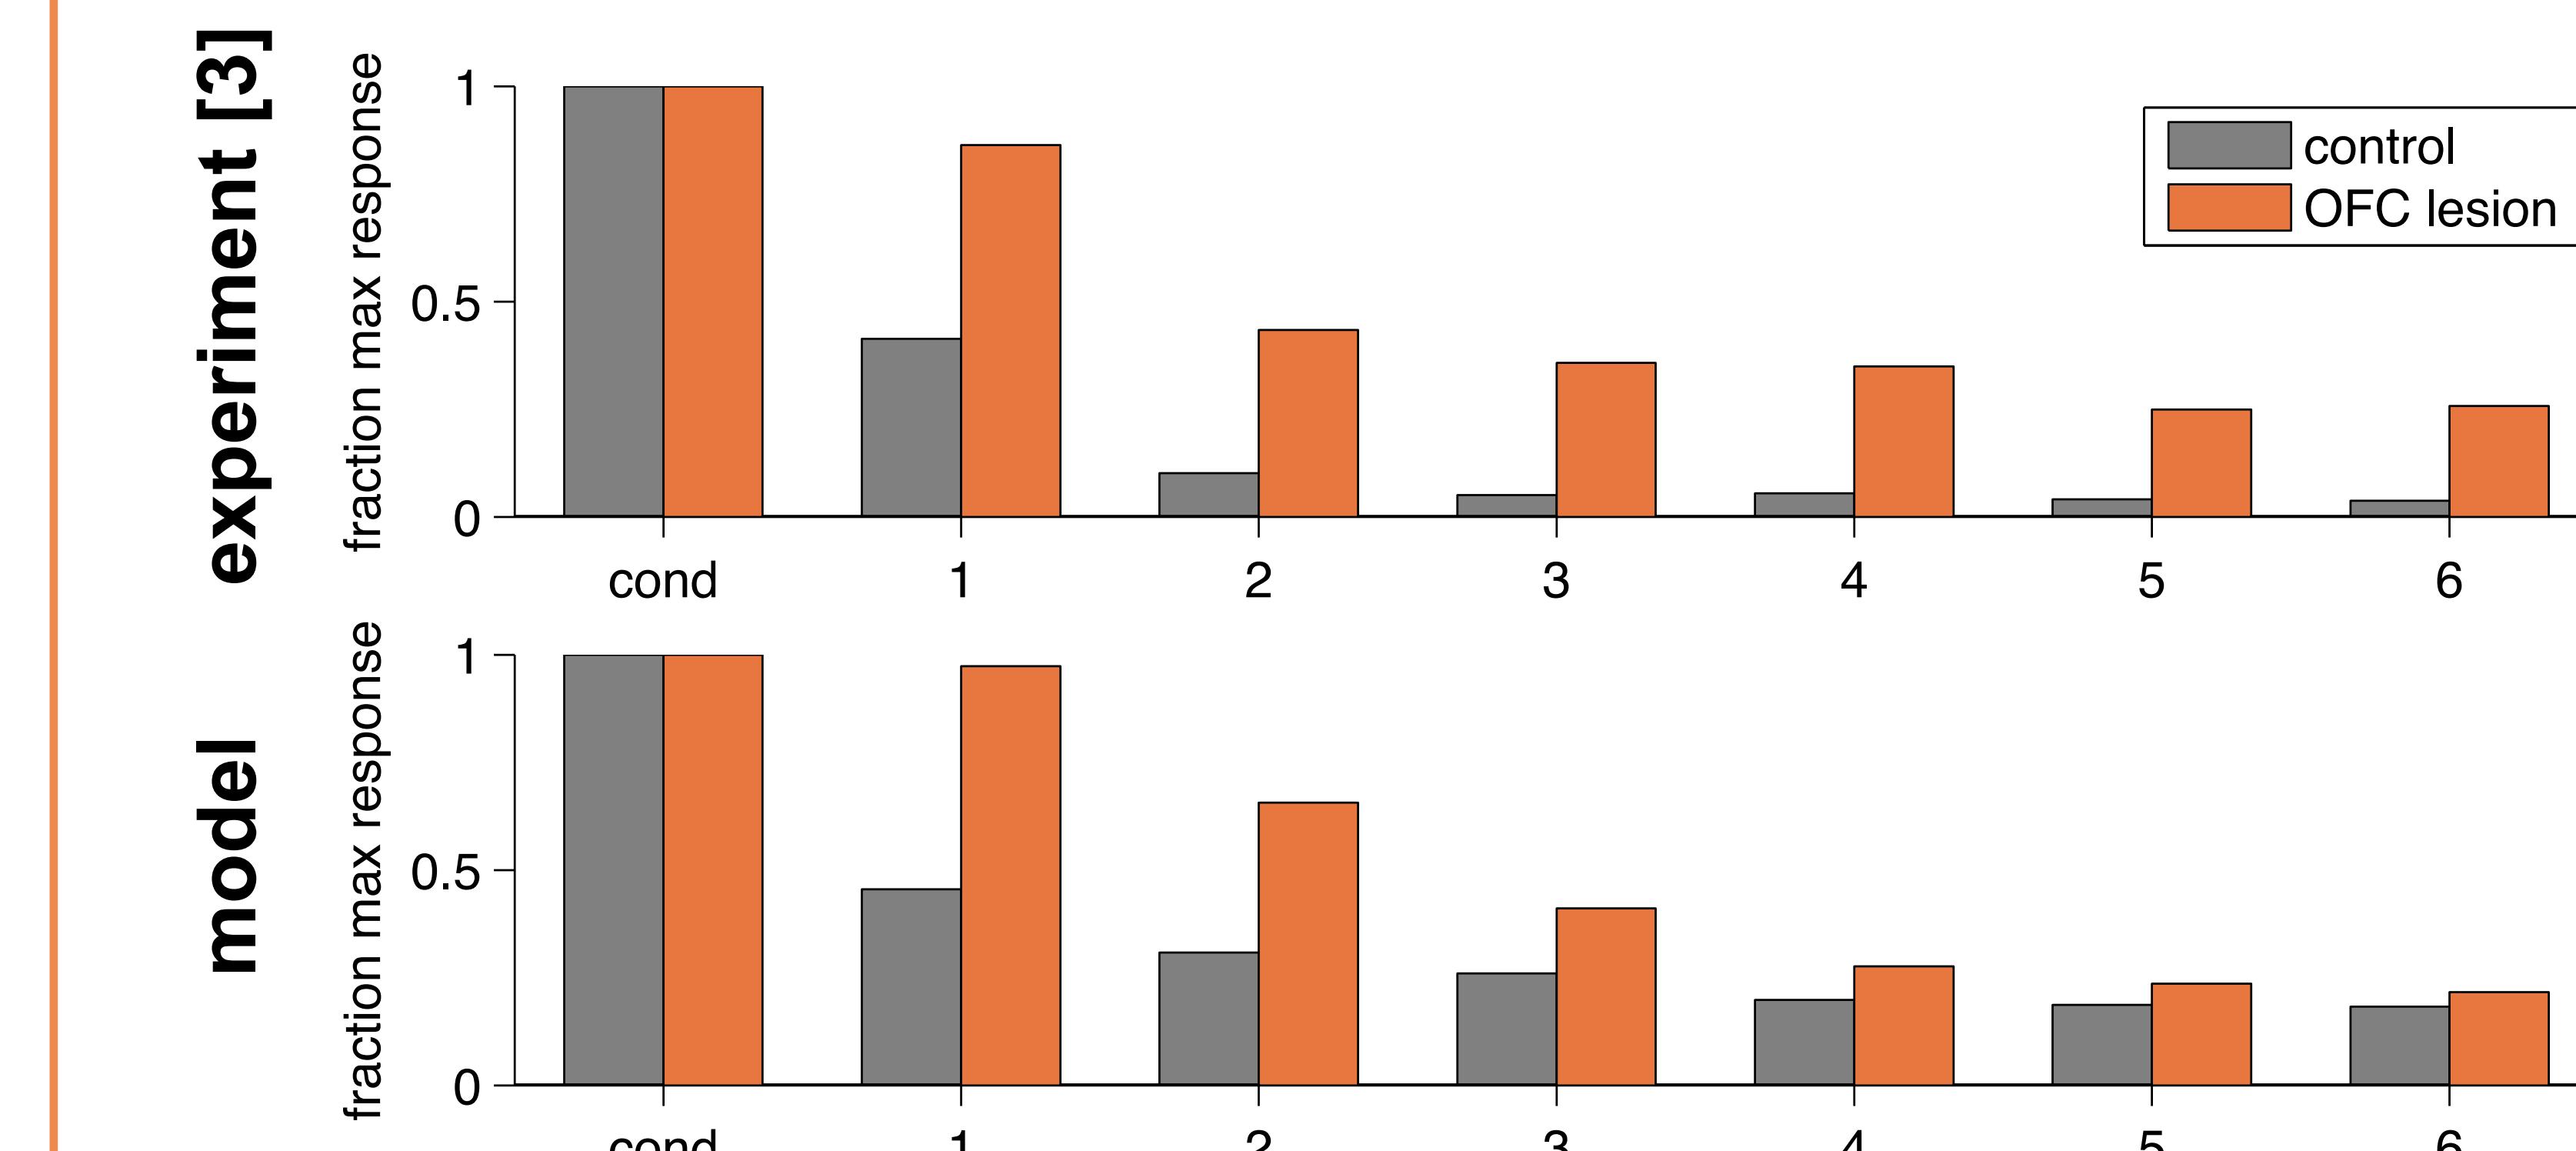

### State-space representation

### Action values

### Behaviour

### Experimental predictions
